

$$\begin{aligned}
f_{15} &= \frac{\partial \alpha_{b_i b_{k+1}}}{\partial \delta b_k^g} = \frac{1}{4} \frac{\partial \mathcal{R}_{b_i b_k} \otimes \left[\frac{1}{2} (\omega - \delta b_k^g) st \right] (a^{b_{k+1}} - b_k^a) \cdot st^2}{\partial \delta b_k^g} \\
&= \frac{1}{4} \frac{\partial \mathcal{R}_{b_i b_k} \cdot \exp\{[(\omega - \delta b_k^g) st]_x\} (a^{b_{k+1}} - b_k^a) st^2}{\partial \delta b_k^g} \\
&= \frac{1}{4} \frac{\partial \mathcal{R}_{b_i b_k} \left(\exp([\omega st]_x) \exp([-J_r(\omega st) \delta b_k^g st]_x) (a^{b_{k+1}} - b_k^a) st^2 \right)}{\partial \delta b_k^g} \\
&= \frac{1}{4} \frac{\partial \mathcal{R}_{b_i b_k} \exp([\omega st]_x) (I + [-J_r(\omega st) \delta b_k^g st]_x) (a^{b_{k+1}} - b_k^a) st^2}{\partial \delta b_k^g} \\
&= -\frac{1}{4} \frac{\partial \mathcal{R}_{b_i b_k} \exp([\omega st]_x) [a^{b_{k+1}} - b_k^a]_x (-J_r(\omega st) \delta b_k^g st) st^2}{\partial \delta b_k^g}
\end{aligned}$$

当 ωst 极小时, $J_r(\omega st) = I$, 即有

$$\begin{aligned}
f_{15} &= -\frac{1}{4} \frac{\partial \mathcal{R}_{b_i b_k} \exp([\omega st]_x) [a^{b_{k+1}} - b_k^a]_x (-J_r(\omega st) \delta b_k^g st) st^2}{\partial \delta b_k^g} \\
&= -\frac{1}{4} \mathcal{R}_{b_i b_{k+1}} [a^{b_{k+1}} - b_k^a]_x st^2 (-st)
\end{aligned}$$

$$\begin{aligned}
g_{12} &= \frac{\partial \alpha_{b_i b_{k+1}}}{\partial n_k^g} = \frac{1}{4} \frac{\partial \mathcal{R}_{b_i b_k} \left[\frac{1}{2} (\omega + \frac{1}{2} \delta n_k^g) st \right] (a^{b_{k+1}} - b_k^a) st^2}{\partial \delta n_k^g} \\
&= \frac{1}{4} \frac{\partial \mathcal{R}_{b_i b_k} \cdot \exp\left\{ \left(\omega + \frac{1}{2} \delta n_k^g \right) st \right\}_x (a^{b_{k+1}} - b_k^a) st^2}{\partial \delta n_k^g} \\
&= \frac{1}{4} \frac{\partial \mathcal{R}_{b_i b_k} \exp([\omega st]_x) \exp\left([J_r(\omega st) \frac{1}{2} \delta n_k^g st]_x \right) (a^{b_{k+1}} - b_k^a) st^2}{\partial \delta n_k^g} \\
&= -\frac{1}{4} \frac{\partial \mathcal{R}_{b_i b_{k+1}} \left([(a^{b_{k+1}} - b_k^a) st^2]_x \right) (J_r(\omega st) \frac{1}{2} \delta n_k^g st)}{\partial \delta n_k^g} \\
&= -\frac{1}{4} (\mathcal{R}_{b_i b_{k+1}} [(a^{b_{k+1}} - b_k^a)]_x st^2) \underbrace{(J_r(\omega st) \frac{1}{2} st)}_{\substack{\rightarrow \text{if } \omega st \rightarrow 0 \\ \rightarrow I}} \\
&\approx -\frac{1}{4} (\mathcal{R}_{b_i b_{k+1}} [(a^{b_{k+1}} - b_k^a)]_x st^2) \left(\frac{1}{2} st \right)
\end{aligned}$$

$$(J^T J + \mu I) \Delta x_{LM} = -J^T f, \text{ when } \mu \geq 0$$

由于半正定矩阵 $J^T J$ 是实对称矩阵，其特征值为 $\{\lambda_i\}$ ，对应特征向量为 $\{v_i\}$ ，则有 $J^T J = V \Lambda V^T$ ， V 为 $J^T J$ 特征向量组成的特征矩阵，且各向量之间相互正交。 Λ 为 $J^T J$ 的特征值组成的对角矩阵，另， $F(x) = (J^T f)^T$

所以：

$$(V \Lambda V^T + \mu I) \cdot \Delta x_{LM} = -J^T f$$

$$(V \Lambda V^T + \mu V V^T) \Delta x_{LM} = -J^T f$$

$$(V \Lambda V^T + V \mu I V^T) \Delta x_{LM} = -F^T$$

$$[V(\Lambda + \mu I)V^T] \Delta x_{LM} = -F^T$$

其中：
$$V = [v_1 \ v_2 \ \dots \ v_n] \quad V^T = \begin{bmatrix} v_1^T \\ v_2^T \\ \vdots \\ v_n^T \end{bmatrix}$$

$$\Lambda + \mu I = \begin{bmatrix} \lambda_1 + \mu & & & \\ & \lambda_2 + \mu & & \\ & & \ddots & \\ & & & \lambda_n + \mu \end{bmatrix}$$

所以：

$$[v_1 \ v_2 \ \dots \ v_n] \begin{bmatrix} \lambda_1 + \mu & & & \\ & \lambda_2 + \mu & & \\ & & \ddots & \\ & & & \lambda_n + \mu \end{bmatrix} \begin{bmatrix} v_1^T \\ v_2^T \\ \vdots \\ v_n^T \end{bmatrix} \Delta x_{LM} = -F^T$$

由于 V ， $\Lambda + \mu I$ ， V^T 均可逆，且 $V^{-1} = V^T$ ，有：

$$\Delta x_{LM} = - \sum_{i=1}^n \frac{v_i^T F^T}{\lambda_i + \mu} v_i, \text{ 证毕}$$
